TITLE: Resources of Raw Materials and Coking Technology of the Donets Gas Coals on the Coking Gas Works

PERIODICAL: Koks i Khimiya, 1959, Nr 10, pp 3-8 (USSR)

ABSTRACT: The distribution of the total output of coal from the Donets basin indicated the largest proportion (35.7%) of rank coals constitute of the coal mined. coal (table 1) about 29 million tons) of the mined for power structure of the consumption of the mined for power structure of the consumers indicated that gas coals are used mainly for consumers indicated. As, however, a possibility of developing generation lump coal, there is a technical and economical require lump coal, there is a technical and economical carbonisation of gas coals. Technical and economical aspects of the above possibility were investigated. The are discussed in the paper. In 1958 the amount of fine gas coals amounted to 5 million tons (mainly burned in industrial and domestic grates) and will increase in 1965 to 9 million tons. The available

Title : The Influence of Long Medicinal Sleep on the Regenerative and Restorative Processes of the Skin in Experimental Animals.

Orig Pub : Vestn. venerol. i dermatologii, 1956, No 2, 6-10

Abstract : Skin burns were caused in 22 rats weighing 140-160 g. After two days, sleep therapy was instituted in 12 animals by means of the subcutaneous introduction of a mixture of 17.5 percent solution of urethane and a 7 percent solution of veronal from a calculation of 0.5

TITLE: Effect of the non-steady state of flow upon the coefficient of the gas-dynamic resistance of gas mains

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Neft' i gaz, no. 7, 1961, 105-112

TEXT: Usually the case of a steady gas flow is assumed in planning and working of gas mains, while in practice non-steady flow occurs as a result of the change of consumption per unit time. It is therefore possible to apply the equations obtained for the steady flow to the analysis of gas-dynamic phenomena which occur in reality. The determination of the accumulation of the gas main is just as important from a practical point of view. The authors deal with new theoretical possibilities of considering the effect of the non-steady state of flow upon the coefficient of the gas-dynamic resistance. The calculations suggested are not difficult in practice. The mathematical formulation of the gas-dynamic resistance may be expressed by means of the following system of Eq.:

Effect of the non-steady ...

$$\rho \frac{dw}{d\tau} = -\frac{\partial p}{\partial z} + \frac{2\tau_0}{r_0}; \qquad \text{(a)}$$

$$\frac{\partial \rho}{\partial \tau} + \frac{\partial}{\partial z}(\rho w) = 0; \qquad \text{(b)}$$

$$dq = di + Ad\left(\frac{w^2}{2}\right); \qquad \text{(c)}$$

$$\frac{p}{\rho} = RTz \qquad \text{(d)}$$

(1)

If both sides of Eq. (1a) are multiplied with dτ and then integrated from 0 to ϑ; Eq. (2) is obtained and the values contained therein are defined by (3). Θ is the time average.

$$\beta_a \rho \frac{d\bar{w}}{d\tau} = -\frac{\partial \bar{p}}{\partial z} + \frac{2}{r_0}\bar{\tau}_0 , \qquad (2)$$

where

Card 2/8

Effect of the non-steady ...

$$\bar{p} = \frac{1}{\theta}\int_0^{\theta} p\,d\tau; \qquad \text{(a)}$$

$$\bar{w} = \frac{1}{\theta}\int_0^{\theta} w\,d\tau; \qquad \text{(b)}$$

$$\bar{\rho} = \frac{1}{\theta}\int_0^{\theta} \rho\,d\tau; \qquad \text{(c)}$$

$$\bar{\tau}_0 = \frac{1}{\theta}\int_0^{\theta} \tau_0\,d\tau; \qquad \text{(d)}$$

$$\beta_\theta = \frac{\frac{1}{\theta}\int_0^{\theta} \rho\frac{dw}{d\tau}\,d\tau}{\rho\frac{d\bar{w}}{d\tau}}. \qquad \text{(e)}$$

(3)

Card 3/8

Effect of the non-steady ...

After further calculations $\beta_{\theta}\,\bar{\rho}\,\bar{w}\,d\bar{w} = -d\bar{p} - C_{f,\,\text{нек}}\,\frac{\rho\,\bar{w}^2}{2}\cdot\frac{dz}{D}$. (8).

is finally obtained. An average can also be obtained in a similar manner for Eq. (1c):

$$d\bar{q} = d\bar{i} + A\beta'_{\theta}\,d\left(\frac{\bar{w}^2}{2}\right), \tag{9}$$

$$\left.\begin{aligned} \bar{q} &= \frac{1}{\theta}\int_0^{\theta} q\,d\tau; && \text{(a)}\\ \bar{i} &= \frac{1}{\theta}\int_0^{\theta} i\,d\tau; && \text{(b)}\\ \beta'_{\theta} &= \frac{\frac{1}{\theta}\int_0^{\theta} d\left(\frac{w^2}{2}\right)d\tau}{d\left(\frac{\bar{w}^2}{2}\right)} \cong \frac{\frac{1}{\theta}\int_0^{\theta}\frac{w^2}{2}\,d\tau}{\frac{\bar{w}^2}{2}}. && \text{(c)} \end{aligned}\right\} \tag{10}$$

Card 4/8

Effect of the non-steady ...

Subsequently, Eq. (1b) is integrated with respect to z and $\rho w \int_z^0 (\partial\rho/\partial\tau)dz = f(\tau)$ (11) is obtained. After multiplying at both sides with πr_0^2, and then with $d\tau$, integration from 0 to Θ,

$$\bar{G} = \frac{1}{\Theta}\int_0^{\Theta} G_\tau\, d\tau = \frac{1}{\Theta}\int_0^{\Theta} \pi r_0^2 f(\tau)\, d\tau = \text{const.} \qquad (13)$$

is obtained. Since, however $\bar{G} = \bar{\rho}\bar{w}\bar{S}$, $\bar{\rho}\bar{w}\bar{S} = \text{const.}$ (14). Finally $\bar{p}/\rho = R\bar{T}z$ (15) is substituted in (1d) for the period of the average. On the basis of (8), (9), (14), and (15), the gas-dynamic resistance at non-steady gas flow in the pipe line may be expressed by the following system of equations:

$$\beta_\theta \rho d\left(\frac{\bar{w}^2}{2}\right) = -d\bar{p} - \bar{C}_{r,\text{исх}}\frac{\bar{\rho}\bar{w}^2}{2}\cdot\frac{dz}{D}; \qquad \text{(a)}$$

$$\bar{\rho}\bar{w}S = \text{const.} \qquad \text{(b)}$$

Card 5/8

Effect of the non-steady ...

$$d\bar{q} = d\bar{i} + A\beta'_{\Theta} d\left(\frac{\bar{w}^2}{2}\right); \qquad (c)$$

$$\frac{\bar{p}}{\rho} = R\bar{T}\bar{z}. \qquad (d) \qquad (16)$$

The system (16) differs from the solution of the previous paper of the authors (Ref. 1) in-so-far as the equations of motion and energy contain the constant coefficients β_{Θ} and β'_{Θ} for the given average. To determine the effect of the non-steady state of the gas flow upon the coefficient of the gas-dynamic resistance, the solutions for the steady gas flow are used and a corresponding correction β_o is made for the inert term, and, instead of p_o and p_1 their average values are substituted in the chosen period of time Θ. In the following the authors give examples which show that the non-steady state depending on the change of velocity in time may both increase and reduce the effect of the inert term and the coefficient of the gas-dynamic resistance. Only in the special case when $\beta_{\Theta} = 1$, the operational conditions of the gas main are analogous to the conditions

Card 6/8

Effect of the non-steady ...

prevailing at a steady flow with respect to the effect of the inert term. The coefficient β_Θ may be determined as follows: First a diagram is plotted of the change of w as a function of time, and then the differential quotient $\frac{dw}{d\tau}$ is determined by graphical differentiation. Below the diagram, the dependence $\varrho = \varrho(\tau)$ is graphically represented. The ordinates of the former diagram are multiplied with the ordinates of the latter and thus the quantity $\varrho\frac{dw}{d\tau}$ is found. On the basis of the last curve, $\int_0^\Theta \varrho\frac{dw}{d\tau}d\tau$ is found by graphical integration. The average quantities ϱ and $\frac{dw}{d\tau}$ are obtained from the diagrams $\frac{dw}{d\tau} = f(\tau)$ and $\varrho = \varrho(\tau)$ by way of graphical integration. On the basis of these data it is not difficult to obtain β_Θ. The methods shown are also applied by the authors to determine the accumulating capacity of the gas mains. Thus, accumulation for the period τ is expressed by the

Card 7/8

Effect of the non-steady ...

equation $G = (G_o - G_\tau)\Theta$ (21) and the total accumulative power by $G = G_o\Theta_1$ (22). There are 3 Soviet-bloc references.
